Abstract

This supplement provides complete set of tables of the Monte Carlo simulation results for the above paper.

1 Data generating process

Observations on y_{it} and x_{it} are generated *jointly* by

$$y_{it} = \mu_i + \delta_t + \lambda_y y_{i,t-1} + (1 - \lambda_y) \beta x_{it} + u_{it}, \quad (1)$$

and

$$x_{it} = (1 - \lambda_x) \mu_{ix} + (1 - \lambda_x) \kappa_x y_{i,t-1} + \lambda_x x_{i,t-1} + v_{it}, \quad (2)$$

for $i = 1, 2, \dots, N$ and $t = -99, -98, \dots, 0, 1, 2, \dots, T$, using $y_{i,-100} = x_{i,-100} = 0$ as the starting values. The first 100 time observations ($t = -99, -98, \dots, 0$) are discarded. The fixed effects and the idiosyncratic errors are generated as:

$$\mu_{ix} \sim IID\mathcal{N}(1, 1), \quad \mu_i = \mu_{ix} + \eta_{yi}, \quad \eta_{yi} \sim IID\mathcal{N}(1, 1), \quad (3)$$

$$v_{it} \sim IID\mathcal{N}(0, \sigma_{vi}^2), \quad \sigma_{vi}^2 = 0.5 + 0.25\eta_{vi}^2, \quad \eta_{vi}^2 \sim IID\chi^2(2), \quad (4)$$

$$u_{it} \sim IID\mathcal{N}(0, \sigma_{ui}^2), \quad \sigma_{ui}^2 = 0.5 + 0.25\eta_{ui}^2, \quad \eta_{ui}^2 \sim IID\chi^2(2). \quad (5)$$

This set up allows the fixed effects in the y_{it} and x_{it} equations to be correlated, which in turn induces correlation between μ_i and x_{it} . For the time effects, δ_t , we consider three possibilities: no time effects, linear time effects, and quadratic time effects, namely

$$\delta_t = 0, 0.025t, \text{ or } 0.025t - 0.001t^2. \quad (6)$$

We consider three values for λ_y , representing a "static" panel regression with $\lambda_y = 0$, and two dynamic panel regressions with a moderate and high values for $\lambda_y \neq 0$:

$$\lambda_y = 0, 0.4, \text{ or } 0.8. \quad (7)$$

*The views expressed in this paper are those of the authors and do not necessarily reflect those of the Federal Reserve Bank of Dallas.

We also consider three values for the feedback coefficient, κ_x (no feedbacks, a low degree of feedbacks, and a medium degree of feedbacks):

$$\kappa_x = 0, 0.2, \text{ or } 0.4. \quad (8)$$

Throughout we set $\beta = 0.5$ and $\lambda_x = 0.25$.

In total, we conducted 27 experiments covering all combinations of δ_t , λ_y and κ_x . All experiments were carried out for all $N \in \{30, 60, 100, 200, 500, 1000\}$ and $T \in \{30, 60, 100, 200\}$ combinations, with the number of replications set to $R = 2,000$.

2 Experiments without lags of the dependent variable

In the case where $\lambda_y = 0$, *i.e.*, experiments 1 – 9, the parameter of interest, β ($= 0.5$), is estimated using the following four estimators:

1. **FE estimator** $\hat{\beta}_{FE}$. In experiments without time effects ($\delta_t = 0$), the FE estimator is based on the panel regression

$$y_{it} = \mu_i + \beta x_{it} + e_{it}. \quad (9)$$

When $\delta_t = 0.025t$ or $0.025t - 0.001t^2$, the FE estimator is based on

$$y_{it} = \mu_i + gt + \beta x_{it} + e_{it}. \quad (10)$$

Note that when $\delta_t = 0.025t - 0.001t^2$, the panel regression model (10) is mis-specified.

2. **Half-panel jackknife FE estimator** $\tilde{\beta}_{FE}$.

3. **FE-TE estimator** $\hat{\beta}_{FE-TE}$ is based on

$$y_{it} = \mu_i + \delta_t + \beta x_{it} + e_{it}. \quad (11)$$

4. **Half-panel jackknife FE-TE estimator** $\tilde{\beta}_{FE-TE}$.

3 Experiments with lagged dependent variables

In these experiments $\lambda_y = 0.4$ or 0.8 , *i.e.*, experiments 10 – 27, and the parameter of interest is given by the long-run coefficient, $\beta = -b/\phi$, where b and ϕ are estimated using the following dynamic panel regressions:

1. **FE estimator** $\hat{\beta}_{FE}$. When $\delta_t = 0$, $\hat{\beta}_{FE}$ is based on

$$\Delta y_{it} = \mu_i + \phi y_{i,t-1} + bx_{it} + e_{it}, \quad (12)$$

and when $\delta_t = 0.025t$ or $0.025t - 0.001t^2$, $\hat{\beta}_{FE}$ is based on:

$$\Delta y_{it} = \mu_i + gt + \phi y_{i,t-1} + bx_{it} + e_{it}. \quad (13)$$

As before, we note that when $\delta_t = 0.025t - 0.001t^2$, the model (13) is mis-specified. β is estimated by

$$\hat{\beta}_{FE} = -\frac{\hat{b}_{FE}}{\hat{\phi}_{FE}}. \quad (14)$$

The estimator for the asymptotic variance of $\hat{\beta}_{FE}$ is obtained by the delta method:

$$\widehat{AsyVar}(\hat{\beta}_{FE}) = \left(\frac{\hat{b}_{FE}}{\hat{\phi}_{FE}^2}, -\frac{1}{\hat{\phi}_{FE}} \right) \widehat{AsyVar} \left(\begin{pmatrix} \hat{\phi}_{FE} \\ \hat{b}_{FE} \end{pmatrix} \right) \left(\frac{\hat{b}_{FE}}{\hat{\phi}_{FE}^2}, -\frac{1}{\hat{\phi}_{FE}} \right)' . \quad (15)$$

2. **Half-panel jackknife FE estimator** $\tilde{\beta}_{FE}$. We first compute the half-panel bias-corrected FE estimators $\tilde{\phi}_{FE}$ and \tilde{b}_{FE} based on $\hat{\phi}_{FE}$ and \hat{b}_{FE} . $\tilde{\beta}_{FE}$ is obtained as

$$\tilde{\beta}_{FE} = -\frac{\tilde{b}_{FE}}{\tilde{\phi}_{FE}},$$

and the estimator for the asymptotic variance of $\tilde{\beta}_{FE}$ is obtained by the delta method similar to (15).

3. **FE-TE estimator** $\hat{\beta}_{FE-TE}$ is based on

$$\Delta y_{it} = \mu_i + \delta_t + \phi y_{i,t-1} + b x_{it} + e_{it}. \quad (16)$$

As in the case of $\hat{\beta}_{FE}$, $\hat{\beta}_{FE-TE} = -\hat{b}_{FE-TE}/\hat{\phi}_{FE-TE}$ and its asymptotic variance is obtained by the delta method, as in (15).

4. **Half-panel jackknife FE-TE estimator** $\tilde{\beta}_{FE-TE}$ is computed in the same way as $\tilde{\beta}_{FE}$, but FE-TE estimators are used instead of the FE estimators.

4 Experiments with unbalanced panels

We also consider unbalanced panels by dropping $[T/5]$ observations from the beginning and from the end of the sample period for units $i = 1, 2, \dots, [N/4]$, and $[T/3]$ observations from the beginning and from the end of the sample periods for units $i = [N/4] + 1, [N/4] + 2, \dots, [N/2]$, where $[a]$ denotes the integer part of a .

5 Experiments with $N = 48$ and $T = 12$

We also consider the case when N and T are only respectively 48 and 12, as in the empirical illustration (Section 6.2). We repeat experiment 9 ($\delta_t = 0.025t - 0.001t^2$, $\kappa_x = 0.4$ and $\lambda_y = 0$) with $N \in \{30, 48, 60, 100, 200, 500, 1000\}$ and $T \in \{12, 30, 60, 100, 200\}$. The results are reported in Table A.55.

6 Monte Carlo Results

The following table summarizes individual experiments and makes it easier to navigate through the Monte Carlo tables and figures reported in this supplement.

List of Experiments

Notes: DGP is given by $\Delta y_{it} = \mu_i + \delta_t - (1 - \lambda_y) y_{i,t-1} + (1 - \lambda_y) \beta x_{it} + u_{it}$, where $x_{it} = (1 - \lambda_x) \mu_{ix} + (1 - \lambda_x) \kappa_x y_{i,t-1} + \lambda_x x_{i,t-1} + v_{it}$, $\beta = 0.5$, $\lambda_y = 0$, $\delta_t = 0$, $\mu_i = \mu_{ix} + \eta_{yi}$, $\eta_{yi} \sim IID\mathcal{N}(1, 1)$, $u_{it} \sim IID\mathcal{N}(0, \sigma_{ui}^2)$, $\sigma_{ui}^2 = 0.5 + 0.25\eta_{ui}^2$, $\eta_{ui}^2 \sim IID\chi^2(2)$, $\lambda_x = 0.25$, $\kappa_x = 0$, $\mu_{ix} \sim IID\mathcal{N}(1, 1)$, $v_{it} \sim IID\mathcal{N}(0, \sigma_{vi}^2)$, $\sigma_{vi}^2 = 0.5 + 0.25\eta_{vi}^2$, $\eta_{vi}^2 \sim IID\chi^2(2)$. $R = 2000$. FE and half-panel jackknifed FE are based on equation (9): $y_{it} = \mu_i + \beta x_{it} + u_{it}$. FE-TE and half-panel jackknifed FE-TE are based on equation (11): $y_{it} = \mu_i + \delta_t + \beta x_{it} + u_{it}$.

Notes: $\beta = 0.5$, $\lambda_y = 0$, $\delta_t = 0.025t$, and $\kappa_x = 0$. FE and half-panel jackknife FE are based on equation (10):

$y_{it} = \mu_i + gt + \beta x_{it} + u_{it}$. FE-TE and half-panel jackknife FE-TE are based on equation (11): $y_{it} = \mu_i + \delta_t + \beta x_{it} + u_{it}$. For the rest of the settings, see the notes for Table A.1.

Figure A.4: Rejection frequency (%) at 5% nominal level with $\delta_t = 0.025t$ and $\kappa_x = 0$ (Experiment 4)

Notes: $\beta = 0.5$, $\lambda_y = 0.4$, $\delta_t = 0$, and $\kappa_x = 0$. FE and half-panel jackknife FE are based on equation (12):

$\Delta y_{it} = \mu_i + \phi y_{i,t-1} + bx_{it} + e_{it}$. FE-TE and half-panel jackknife FE-TE are based on equation (16):

$\Delta y_{it} = \mu_i + \delta_t + \phi y_{i,t-1} + bx_{it} + e_{it}$. For the rest of the settings, see the notes for Table A.1.

Table A.10.2: Bias ($\times 100$), RMSE ($\times 100$) and Size (%) at 5% nominal level with $\lambda_y = 0.4$, $\delta_t = 0$ and $\kappa_x = 0$ (Experiment 10, continued)

Notes: $\beta = 0.5$, $\lambda_y = 0.4$, $\delta_t = 0.025t$, and $\kappa_x = 0$. FE and half-panel Jackknifed FE are based on equation (13):

$\Delta y_{it} = \mu_i + gt + \phi y_{i,t-1} + bx_{it} + e_{it}$. FE-TE and half-panel Jackknifed FE-TE are based on equation (16):

$\Delta y_{it} = \mu_i + \delta_t + \phi y_{i,t-1} + bx_{it} + e_{it}$. For the rest of the settings, see the notes for Table A.1.

Table A.13.2: Bias ($\times 100$), RMSE ($\times 100$) and Size (%) at 5% nominal level with $\lambda_y = 0.4$, $\delta_t = 0.025t$ and $\kappa_x = 0$ (Experiment 13, continued)
